

Getting access

New employees request a laptop and account through the IT portal. A manager approves access before IT provisions accounts. Employees should use their company email address for all support requests. The IT team confirms completion by email.

VPN setup

To request VPN access, submit the VPN access form in the IT portal and select your department. After approval, install the VPN client from the software catalog. Sign in with your company account and complete multi-factor authentication. If the client displays an authentication error, verify the system clock and retry. Contact the help desk if the error continues.

Password reset

If you forget your password, open the account recovery page and choose Reset password. Confirm your identity using the registered authentication method. Create a new password and sign in again. If you cannot access your recovery method, contact the help desk and provide your employee ID. Never share a verification code with another person.
